

I can identify many cars in the side of roads along with some smaller trucks with good back compartment open.

Near the vehicle I can see a vehicle with many wheels and a large chasis but not the complete body near the lidar sensor. As the height of the vehicle increases, color intensity decreases from dark blue to lighter colors like green, yellow, and then becomes red at last. I can see the few sedan type cars whose windows allows for penetration of waves from lidar to greater distances. As the distance from lidar increases, the structure of the wheel diminishes and only the body of the vehicle is shown like a box. Even though some cars have spoilers, those are visible only when near the lidar sensor. As I cannot zoom more, the vehicles are like toy boxes. Even I can see a structure like human being and a barricade, they aren't clear.

Below is the snapshot.
